Representing Land in the Earth System I: Biogeophysics Will Wieder CESM Tutorial 2024

This material is based upon work supported by the NSF National Center for Atmospheric Research, which is a major facility spored by the U.S. National Science Foundation under Cooperative Agreement No. 1852977.

Representing Land in ESMs:

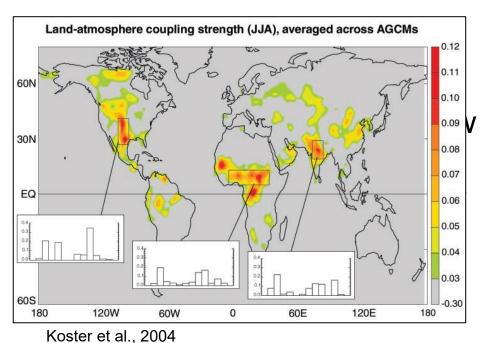

- Why?
- How?
- Future directions

Land-Atmosphere Interactions

How much does a precipitation induced soil moisture anomaly influence the atmosphere, the evolution of weather, and the generation of precipitation?

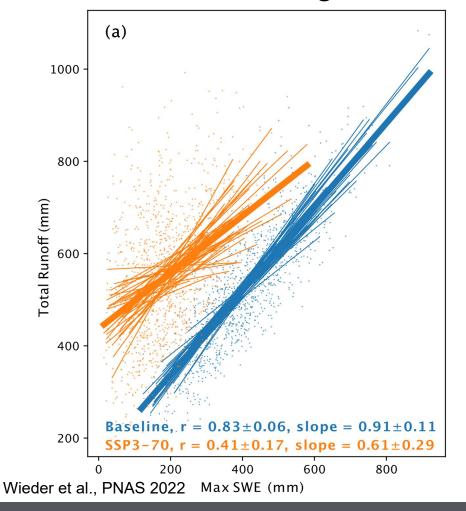

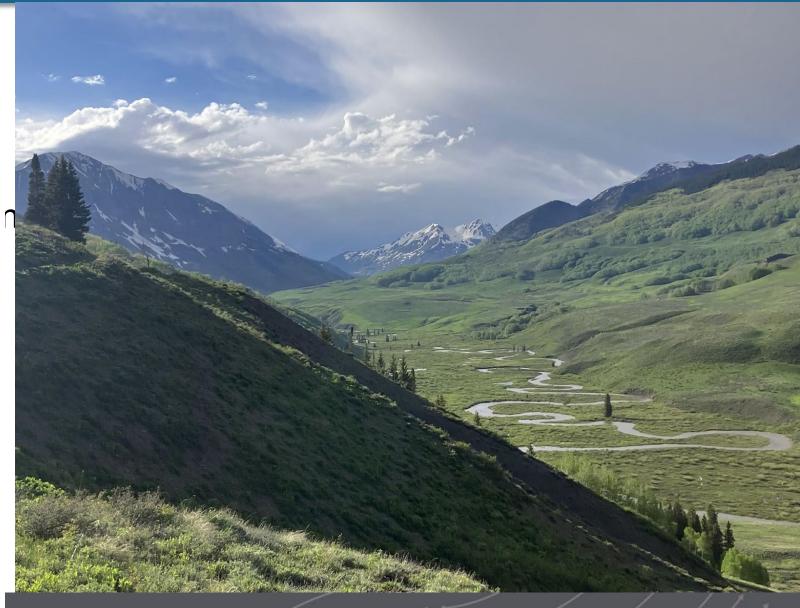

Land Modeling: Why?

How are water (and food) resources under threat from climate change?

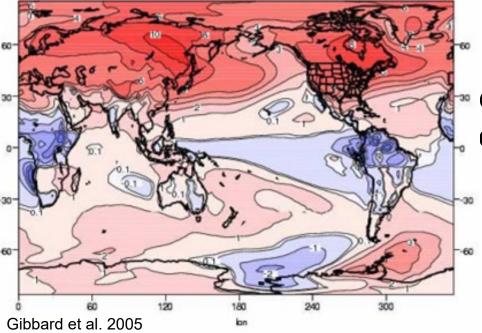

Land Modeling: Why?

Land Use and Land Cover Change

How do changes in land properties affect water, energy & biogeochemical feedbacks in the Earth system?

How does the Earth system respond to change on Land?

Deforestation (courtesy NPR)

Permafrost Thaw (Nat. Geo.)

Agriculture (John K Forest Fires (Columbia)

Land Modeling in CESM

Motivation:

Land is the critical interface through which humanity affects and is affected by, adapts to, and mitigates global environmental change

Goal:

Comprehensive representations of land biogeophysics, hydrology, plant physiology, biogeochemistry, anthropogenic land use, agricultural management, ecosystem dynamics, and urban environments

Land Modeling in ESMs: How

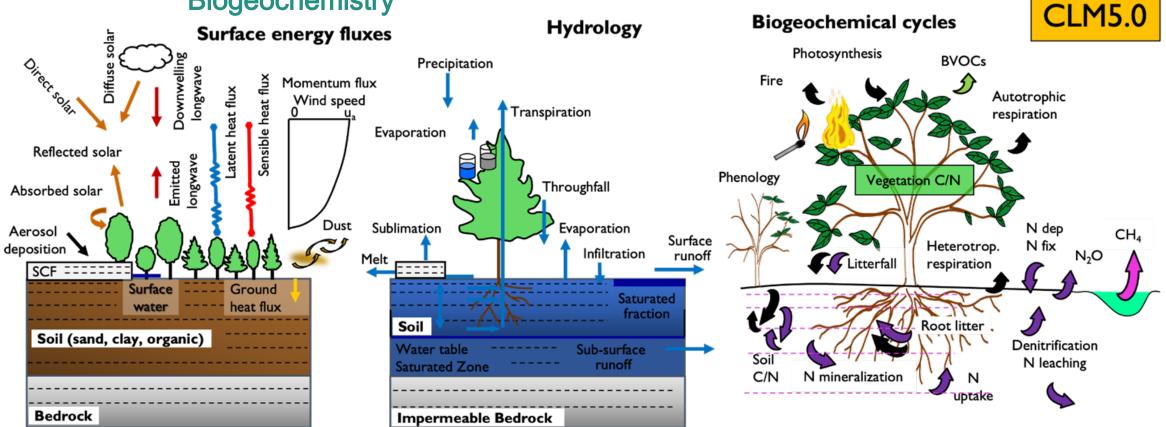

- Exchanges of momentum, energy, water vapor, GQust, and other trace gases/materials between land and atmosphere + routir of runoff to the ocean
- States of land surface (e.g., soil moisture, soil temperature, canop temperature, snow, carbon and nitrogen stocks in vegetation and soil)
- Characteristics of land surface (e.g., soil texture, surface roughness, albedo, emissivity, vegetation type, and leaf area index

Key Processes within CLM / CTSM

Biogeophysics

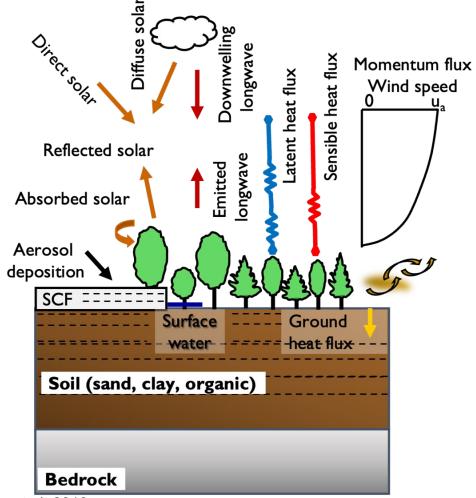

Biogeochemistry

Lawrence et al. 2019

At each time step CLM solves the Surface Energy Balance

Surface energy fluxes

$S^{\downarrow}-S^{\uparrow} + L^{\downarrow}-L^{\uparrow} = \lambda E + H + G$

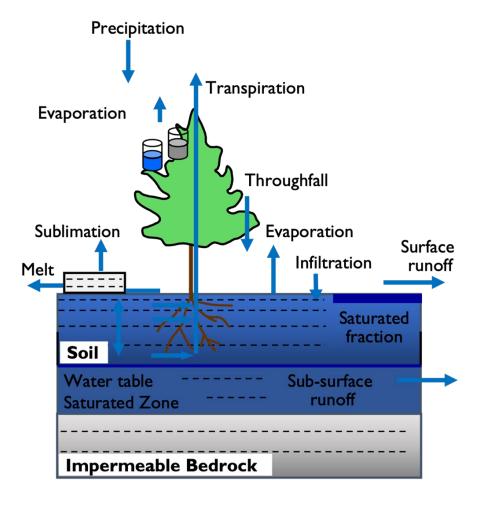

S¹, S[†] are down / upwelling solar radiation, L¹, L[†] are down / upwelling longwave radiation, λ is latent heat of vaporization,

E is evaporation,

- H is sensible heat flux
- G is ground heat flux

... and the Surface Water Balance

 $P = ES + ET + EC + R + (\Delta W_{soil} + \Delta W_{snow} + \Delta W_{sfcw} + \Delta W_{can}) / \Delta t$

P is rainfall/snowfall,

ES is soil evaporation,

ET is transpiration,

EC is canopy evaporation,

R is runoff (surf + sulsurface),

 $\Delta W_{soil}, \Delta W_{snow}, \Delta W_{sfew}, \& \Delta W_{can}$ are changes in soil moisture, snow, surface water, and canopy water over a timestep

Lawrence et al. 2019

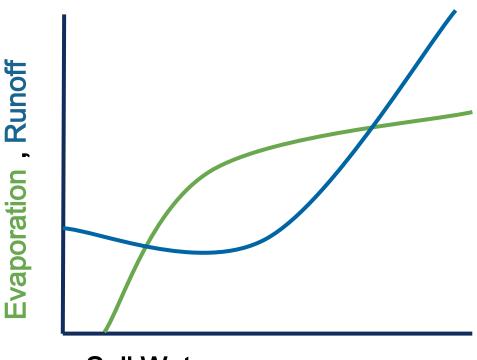

Land Modeling: How?

"The ability of a landsurface scheme to model evaporation correctly depends crucially on its ability to model runoff correctly. The two fluxes are intricately related through soil moisture."

(Koster and Milly, 1997).

What is this statement missing?

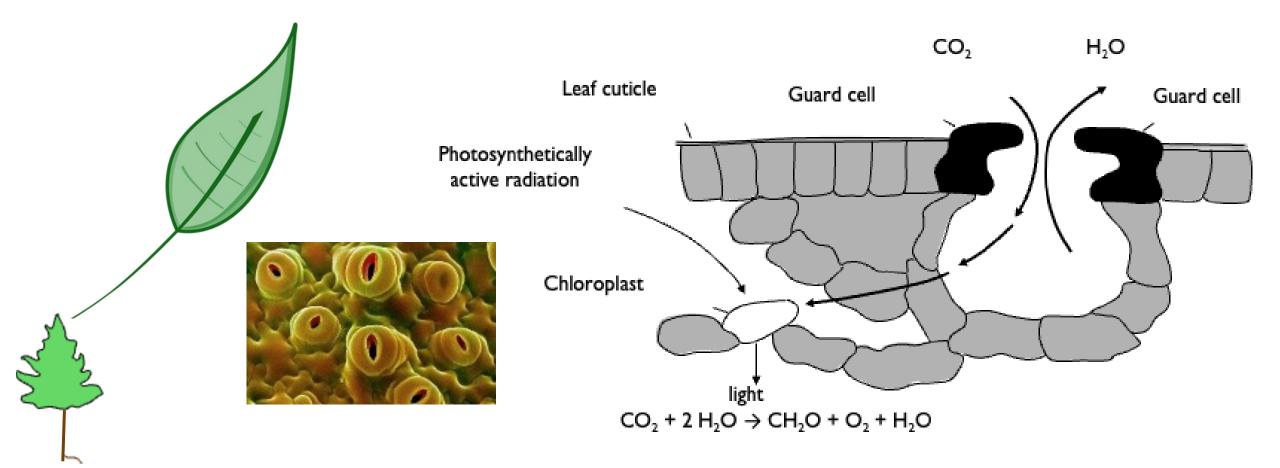

Soil Wetness

Photosynthesis model

Plant physiological controls on transpiration and Sexchange Function of solar radiation, humidity deficit, soil moisture, [G, Demperature, leaf N content

Land Modeling: How?

Land Complexity: Submodules of CLM

Biogeophysics (SP mode)

- Photosynthesis and stomatal resistance
- Hydrology
- Snow
- Soil thermodynamics
- Surface albedo and radiative fluxes

Biogeochemistry (BGC mode, above +)

- Carbon / nitrogen pools, allocation, respiration
- Vegetation phenology
- Plant Mortality
- Decomposition
- External nitrogen cycle
- Methane production and emission

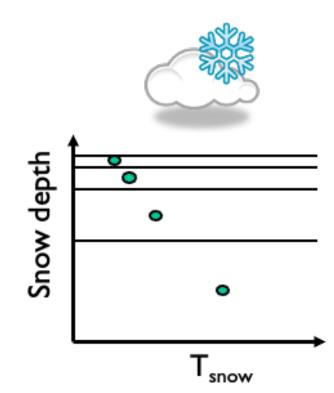

And...

- Urban
- Crop and irrigation
- Lakes
- Fire and fire emissions
- Dust emissions
- Biogenic Volatile Organic Compound emissions
- Glaciers and ice sheets
- River flow
- Vegetation demography

Land Model Complexity: Snow

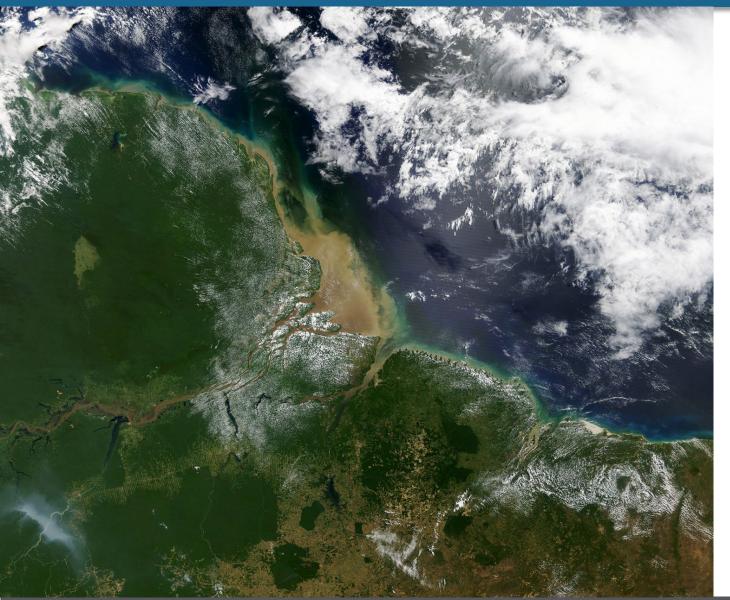

State Variables $N, w_{liq,i}, w_{ice,i}, \Delta z_i, T_i$

- Up to 10-layers of varying thickness
- Represented processes
 - Accumulation and fresh snow density: T, wind)
 - Melt, refreezing, aging
 - Compaction
 - destructive metamorphism(T, wind)
 - overburden
 - melt-freeze cycles
 - Sublimation
 - Water and energy transfer across snow layers
 - Aerosol (black carbon, dust) deposition
 - Canopy snow storage and unloading
 - Canopy snow radiation
 - Snow burial of vegetation
 - Snow cover fraction
- Missing processes
 - Blowing snow
 - Subgrid variations in snow depth
 - Depth hoar

Land Model Complexity: Plants

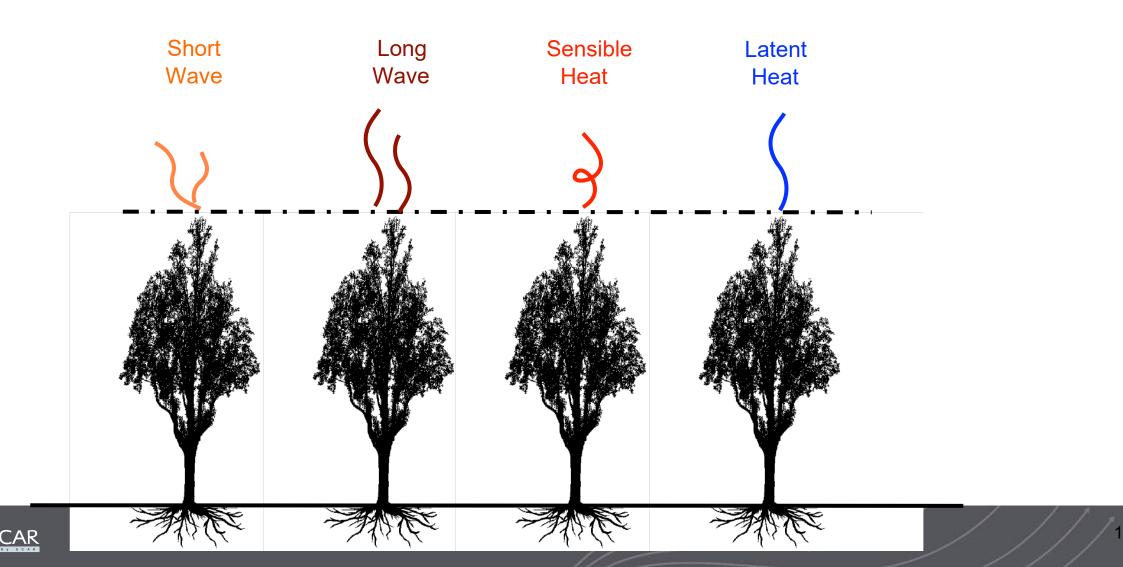

Blue marble...

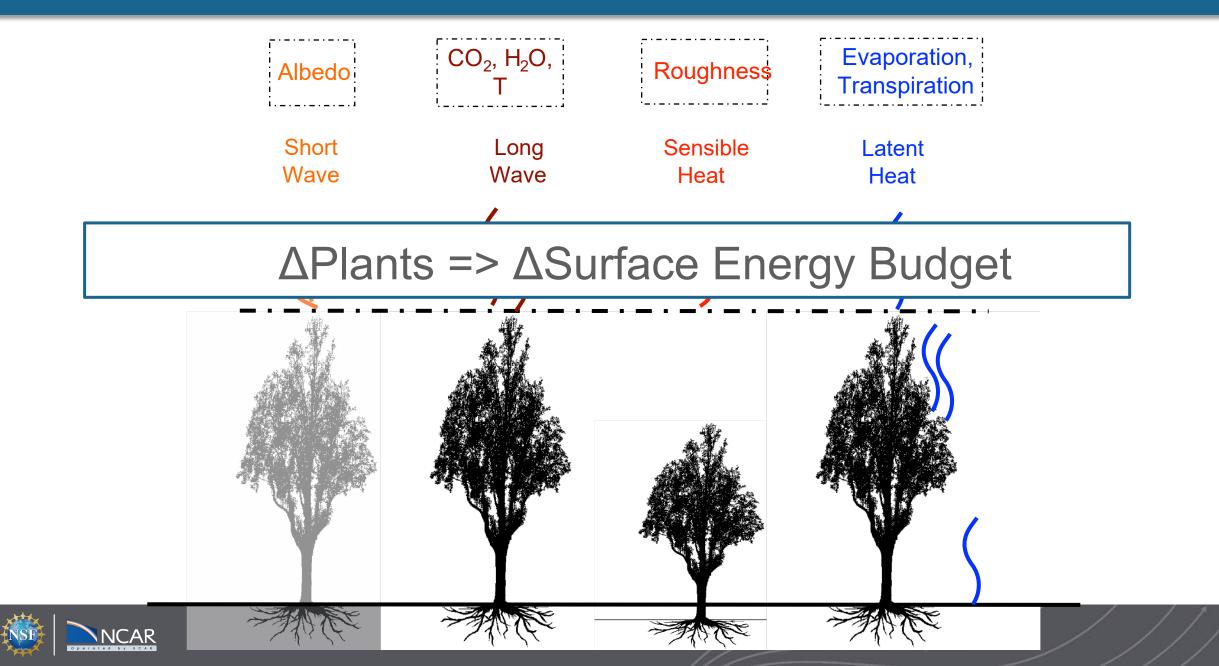

... Green Earth

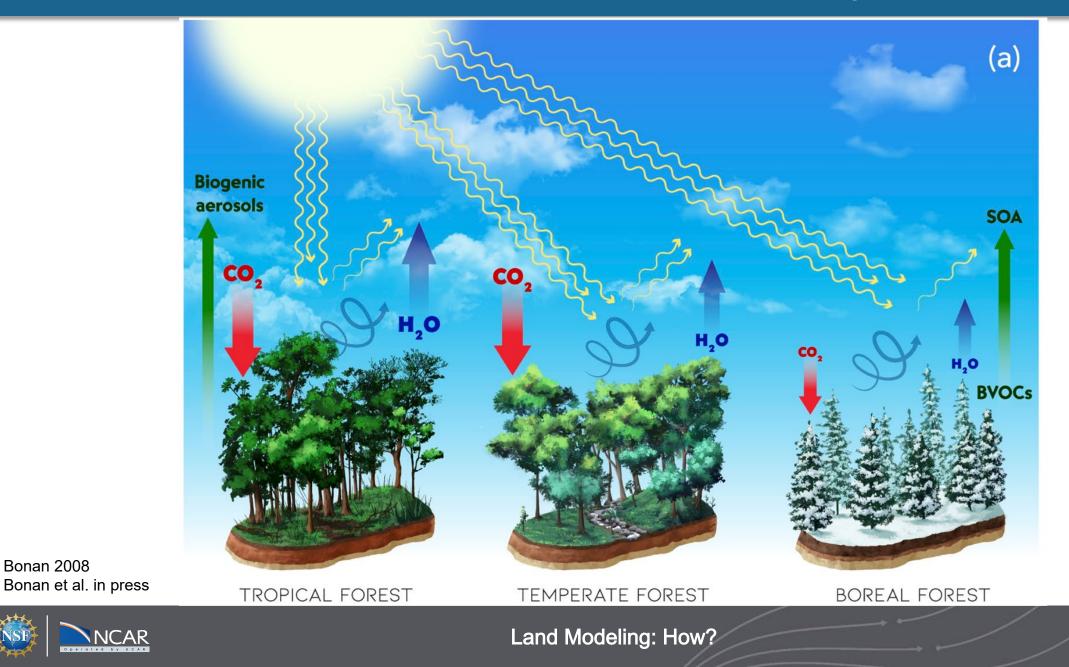

Terrestrial surface energy budget

How do plants and climate interact?

Not all forests have the same climate impact

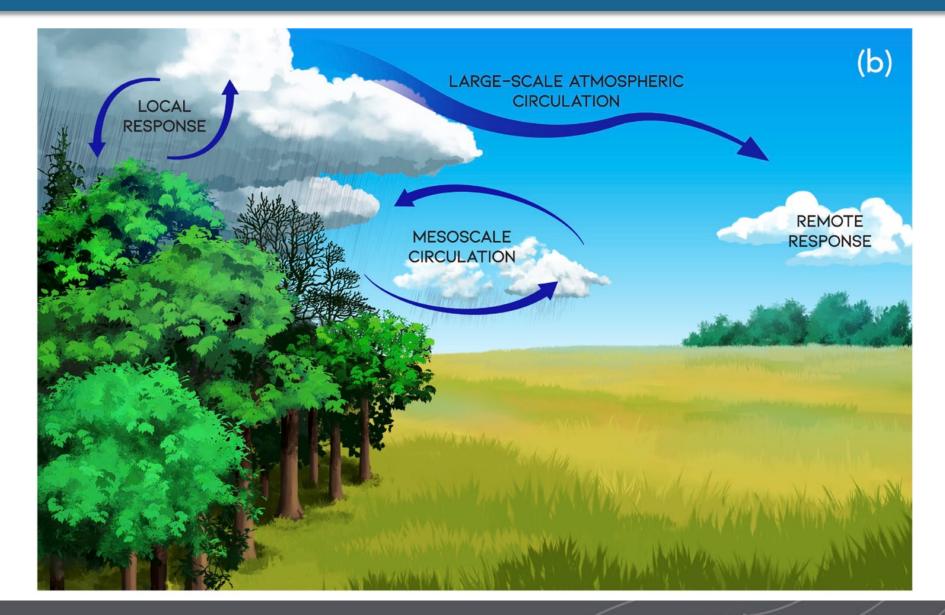

Bonan 2008

Land Modeling: Future Directions

Hillslope Hydrology

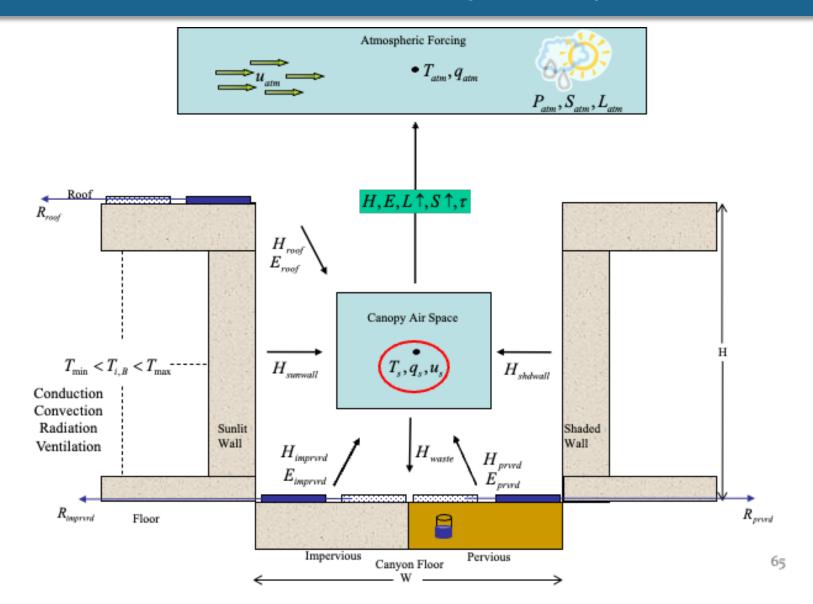

Explicit Lateral Flow Within Gridcell

Downscaled Meteorology

CLM-Urban Model (CLM -U)

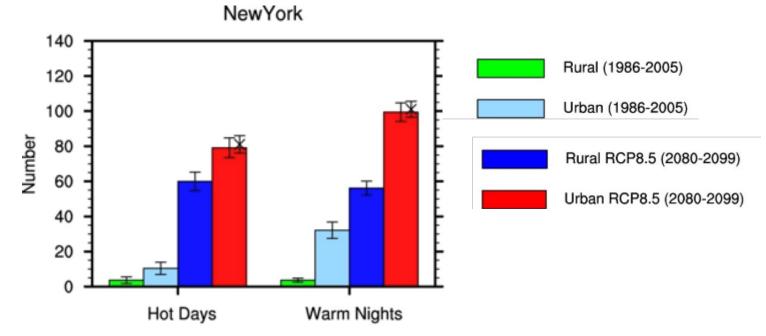

CAR

CLM-Urban Model (CLM -U)

- New Urban Extent (2000-2100): Gao and O'Neill (2020), Gao and Pesaresi (2021), replaces static circa-2000 Jackson et al. (2010)
- Dynamic Urban Capability changes in urban extent over time (Fang et al. 2024)
- Improved Urban Properties: Oleson and Feddema (2019), modifies Jackson et al. (2010)
- Explicit Air Conditioning Adoption: Li et al. (2023)

Present -day climate

Cities have more hot days and warm nights than rural land

21st century climate change

Cities increase more in hot days and warm nights than does rural land

Abbreviated list of land biophysical features in CESM3+

Emission Driven Focus

Interactive Fires

Updatedsurface datasets, dust scheme, roughness length, snow optical properties, excess ice, crop calendars, more...
