

# Land Ice Working Group session

12 minutes talk + 3 minutes for questions

Time	Topic	Speakers
8:30	<b>Welcome</b>	co-chairs
8:35	Land ice update	Gunter Leguy
8:50	Land ice SE updates	Kate Thayer-Calder
9:05	A path towards adding Solid Earth in CESM	Kate Thayer-Calder
9:20	Implementation of the Restart Option in CitcomSVE3.0: A 3D Finite Element Model for Glacial Isostatic Adjustment	Kaixuan Kang
9:35	Updates on mountain glacier work and next steps	Samar Minallah
9:50	<b>Break</b>	
10:15	Resolution dependence of CISM Greenland initialisation and projections	Heiko Goeltzer
10:30	Forced future Antarctic simulations, with extras	Tim van den Akker
10:45	Southern Ocean freshwater hosing experiments: Results from NorESM simulations with a coupled Greenland Ice Sheet	Dave Chandler
11:00	Antarctic ice sheet coupling within the Norwegian Earth System Model: advances and challenges	Michele Petrini
11:15	How calving observations can inform models	Joanna Millstein
11:30	New calving laws in CISM	Bill Lipscomb
11:45	Discussion	All
12:15	<b>Session Adjourned</b>	
	Lunch at the NSF NCAR ML cafeteria for people attending in person	

- Please mute your cell phone
- Join the meeting on your computer using companion mode

# Many Thanks to our administrative and multimedia team

**Elizabeth Faircloth**

**Daniel Sena**

**Teresa Walz**

**Kailyn Kampert**

**Keila DeBellis**

**Paul Martinez**

**Joey Erhman**

# Land ice updates

***Gunter Leguy, Bill Lipscomb, Kate Thayer-Calder, Samar Minallah  
And the LIWG community***

**LIWG winter meeting 2025, January 28th**

- **CESM3 (Community Earth System Model version 3)**
  - Timeline
  - GrIS and AIS coupling in CESM
  - Land ice diagnostics (including CUPiD)
- **CISM (Community Ice Sheet Model)**
  - Future release
  - Input file creation
- **Future events**

# LIWG land ice plans for CESM3

# Land ice timeline plans for CESM3

**CUPiD is a “one stop shop” that enables and integrates timeseries file generation, data standardization, diagnostics, and metrics from all CESM components.**

- Collaborative effort
- Simplify user experience of running diagnostics
- Call post-processing tools directly from CUPiD
- Run all component diagnostics from one tool as either part of the CIME workflow or independently
- Shared python code and a standard conda environment across components.

Teagan King  
[tking@ucar.edu](mailto:tking@ucar.edu)

Michael Levy  
[mlevy@ucar.edu](mailto:mlevy@ucar.edu)

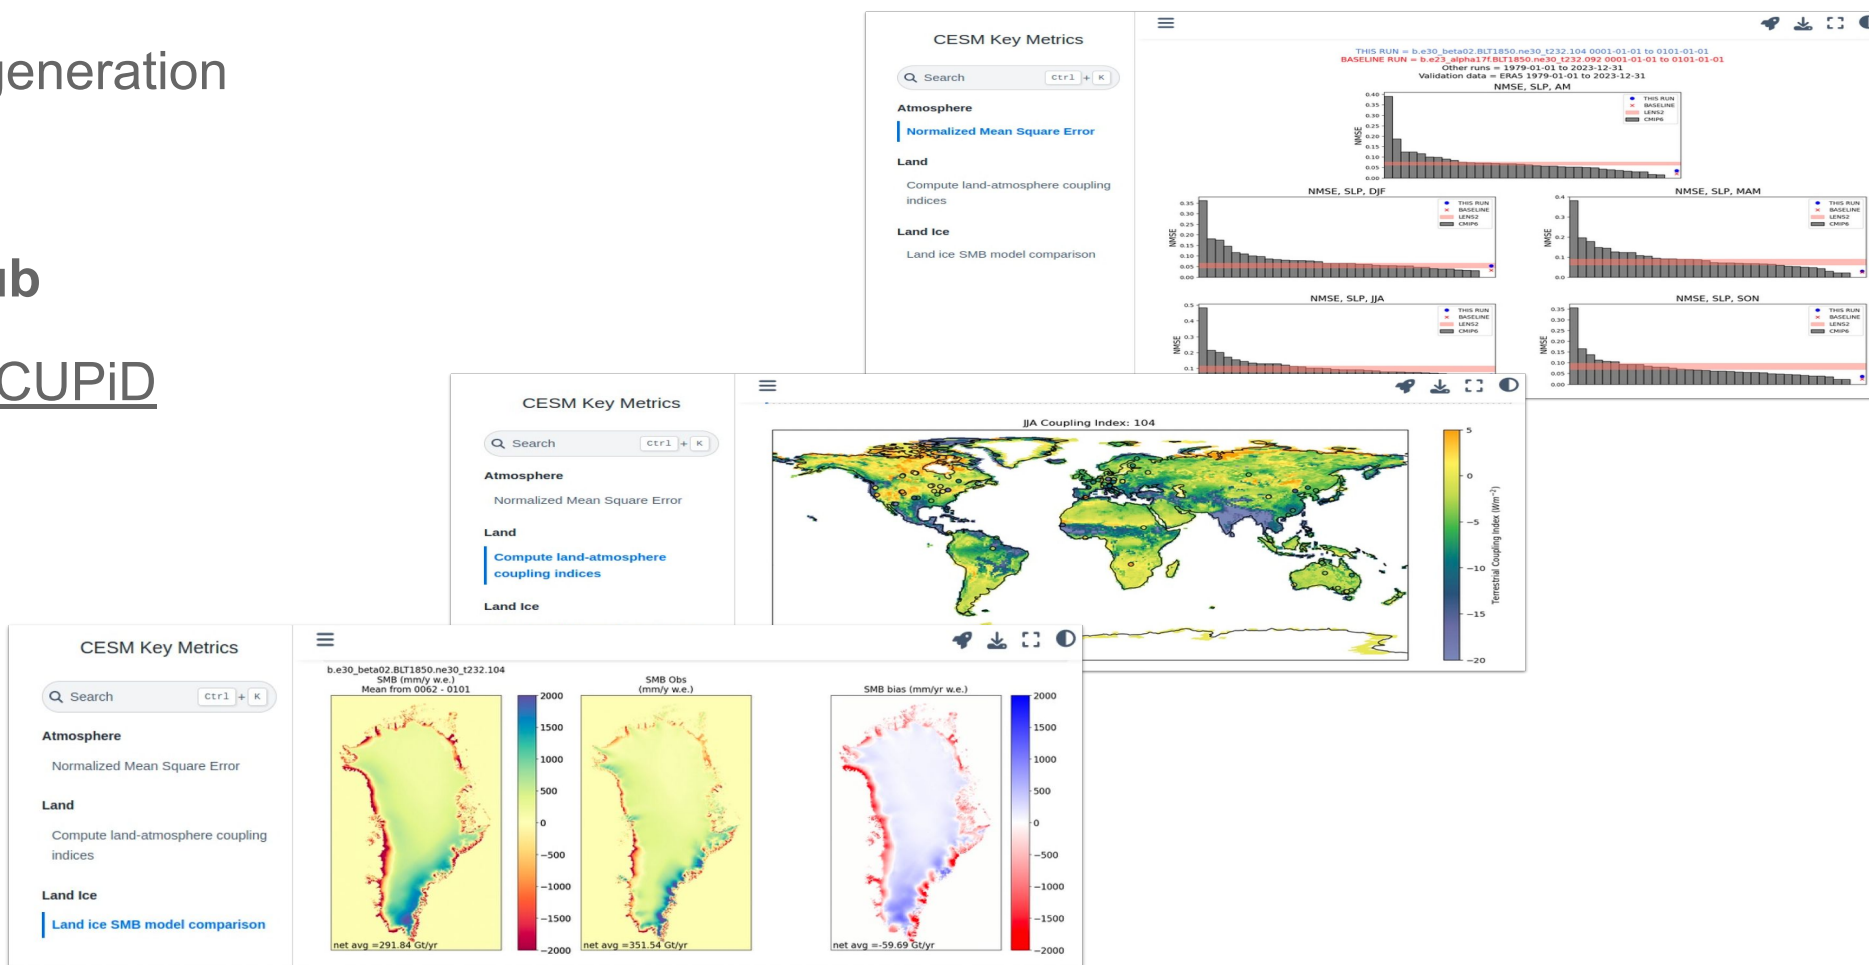

# CUPiD Current Status

- Can be run from CESM workflow or independently (in progress)
- Key metrics from glc, atm, lnd & examples from all components
- Basic timeseries file generation
- [Documentation](#)
- **Contribute via GitHub**

<https://github.com/NCAR/CUPiD>

# Land ice diagnostics in CUPiD this far

Right now land ice notebook only looks at PI control for SMB

**Fig:** Example of running CUPiD: comparing CESM3 PI run (#121) to MAR using 40 year climatology. (left) Spatial SMB comparison. (Right) time series evolution of the last 40 years of the PI compared to the PI climatology and MAR means.

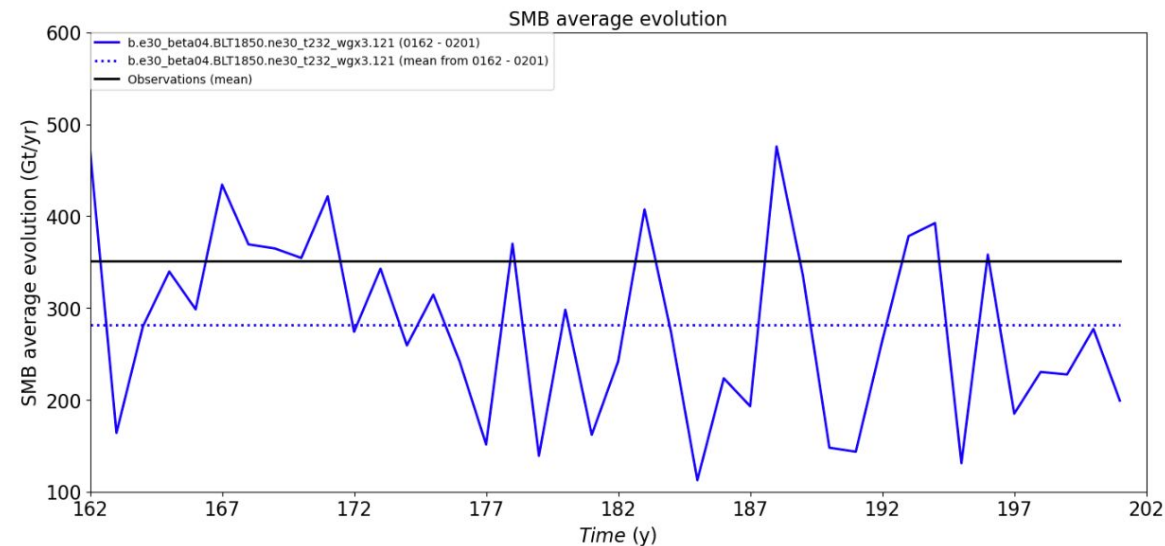

b.e30\_beta04.BLT1850.ne30\_t232\_wgx3.121  
SMB (mm/y w.e.)  
Mean from 0162 - 0201

SMB Obs  
(mm/y w.e.)

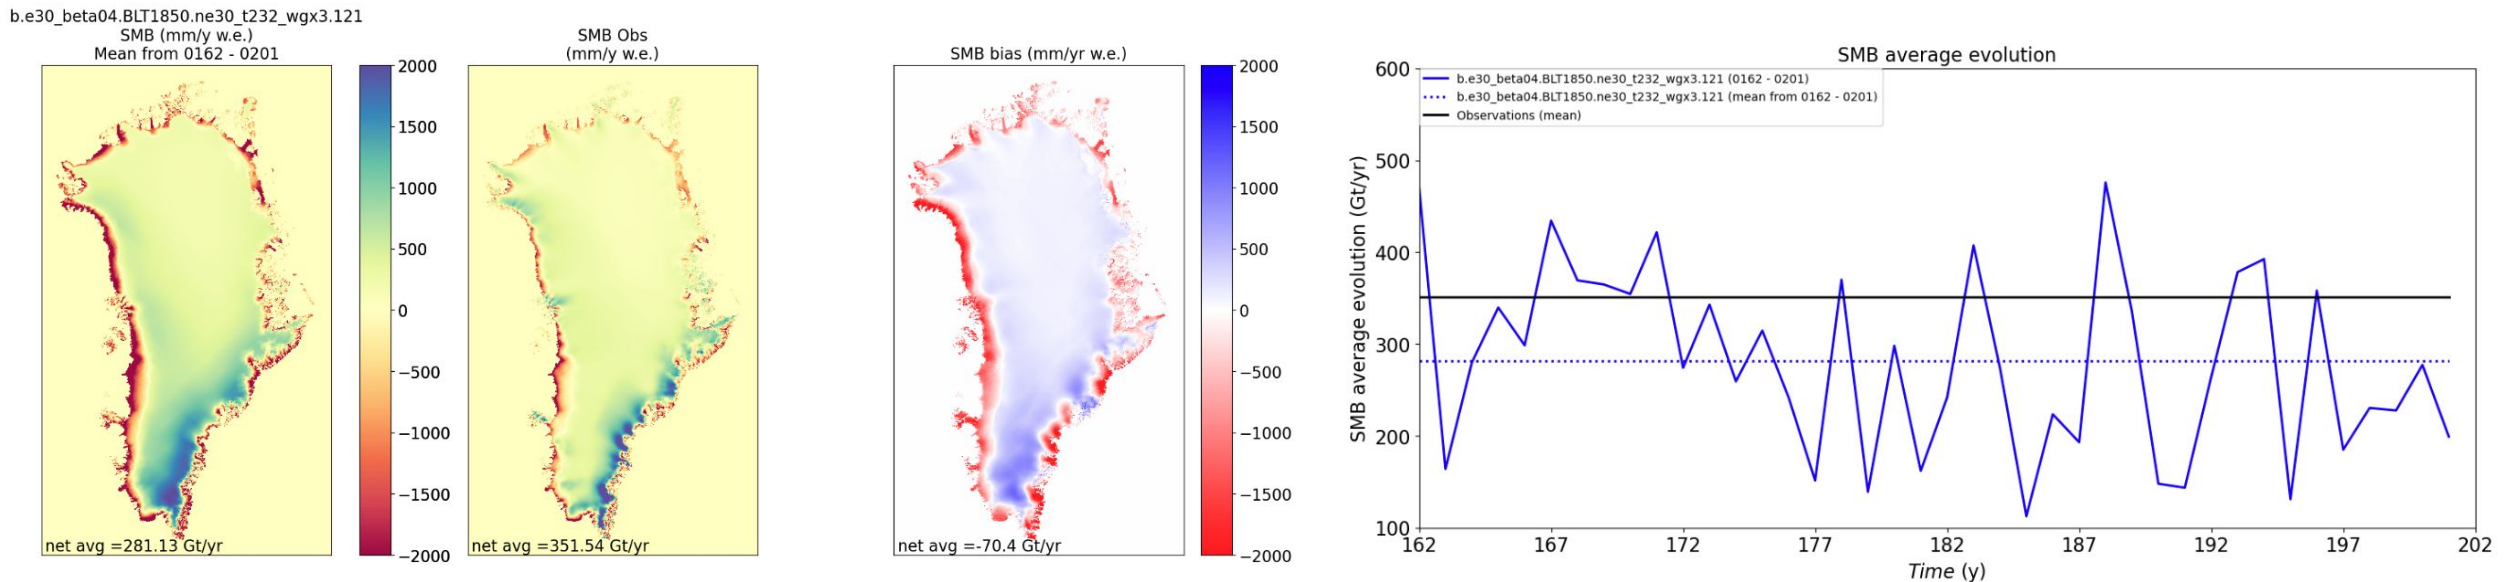

SMB bias (mm/yr w.e.)

# Land ice diagnostics in CUPiD this far

Right now land ice notebook only looks at PI control for SMB

**Fig:** Example of running CUPiD: comparing CESM3 PI run (#121) to MAR using 40 year climatology. (left) Spatial SMB comparison. (Right) time series evolution of the last 40 years of the PI compared to the PI climatology and MAR means.

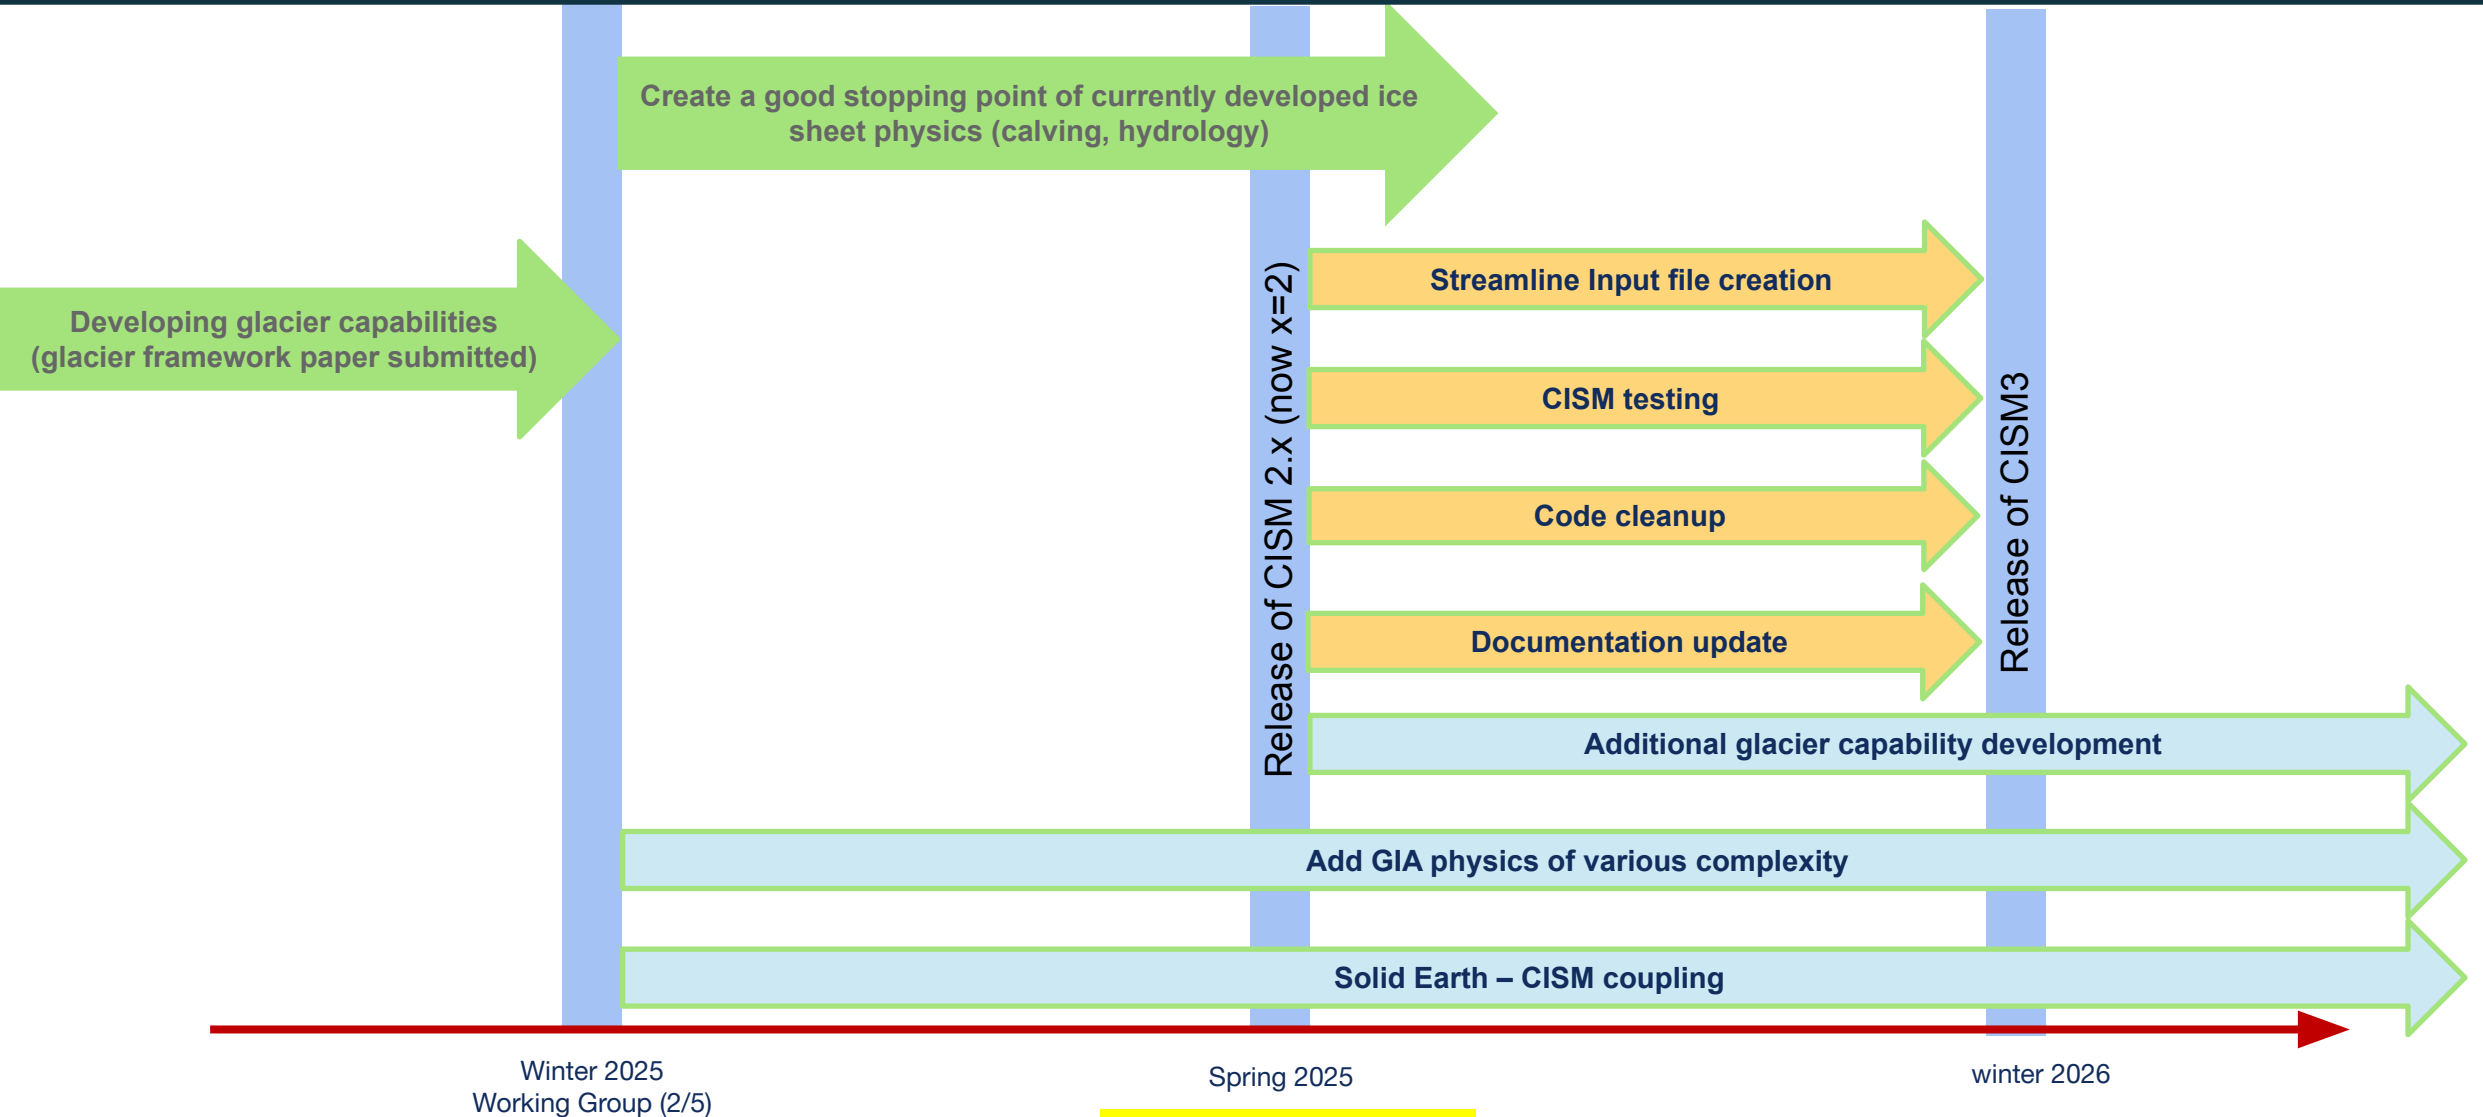

In progress:

- Notebook analyzing historical runs: annual and seasonal averages and climatology.
- Notebook analyzing other variables: precip, runoff, surface temp

# Release plans for CISM

Click to add footer

## 1. Define CISM grid file

- Create the thickness and velocity grids in cartesian space
- Scripts are available to create SCRIP files for CESM regriding or ESMF interpolation tools.

1. Define CISM grid file

2. Interpolate observation

- Each observational product organized by “data type” and source.
- Data type:
  - Topography (thk, bed, mask), SMB and air temp, Geothermal heat flux, Ice velocity, thermal forcing, ocean basin number, ice domain mask, mass change rate.

# CISM input file creation (workflow)

1. Define CISM grid file

2. Interpolate observation

3. Define input in CISM config file

- **Define one input file for the CISM config file**

- 1 notebook for that.

**Config layout in CISM:**

```
[CF input]
name = input_file_name.nc
```

- **Define several input file in the CISM config file**

**Config layout in CISM:**

```
[CF input]
name = input_file_name1.nc
[CF input]
name = input_file_name2.nc
...
```

- **CISM reads the input files in order**

# CISM input file creation

- 1 Jupyter notebook per task and data type.
- Right now, data for AIS only, GrIS to come (using the same notebooks).
- Jupyter notebooks and available data are located on Derecho:  
`/glade/campaign/cesm/community/liwg/cism_input`

```

## NOTES

1. Notebooks can be used by the community and they are still in development!
  - We welcome feedback for improvements and user friendliness
2. Right now, none of the notebook in this directory include data smoothing beyond the interpolation step.
3. We are thinking in adding them to version control (Github) as part of the CISM code somewhere.
4. Don't hesitate to contribute to the available dataset !

## CESM summer workshop June 9-11 2025

- 30<sup>th</sup> anniversary
- Would like to make it special
- Please come if you can

## CESM summer tutorial July 7-11 2025

- Deadline for registration extended to February 7<sup>th</sup> 2025
- Decision on attendance made by April 18 2025
