

# Tracking the imprint and impact of spatiotemporal variability of CO<sub>2</sub> emissions

Gretchen Keppel-Aleks  
University of Michigan  
gkeppela @ umich.edu

**Why should we track atmospheric CO<sub>2</sub> in emissions driven CESM simulations?**

# Atmospheric CO<sub>2</sub> provides unique constraints on Earth system processes

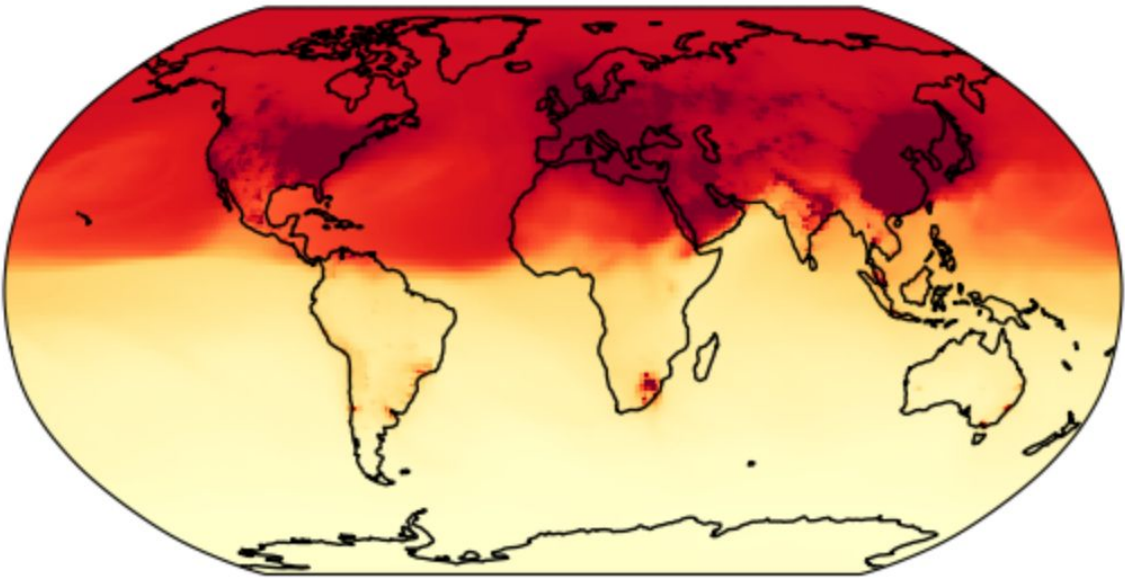

Graven et al., 2013

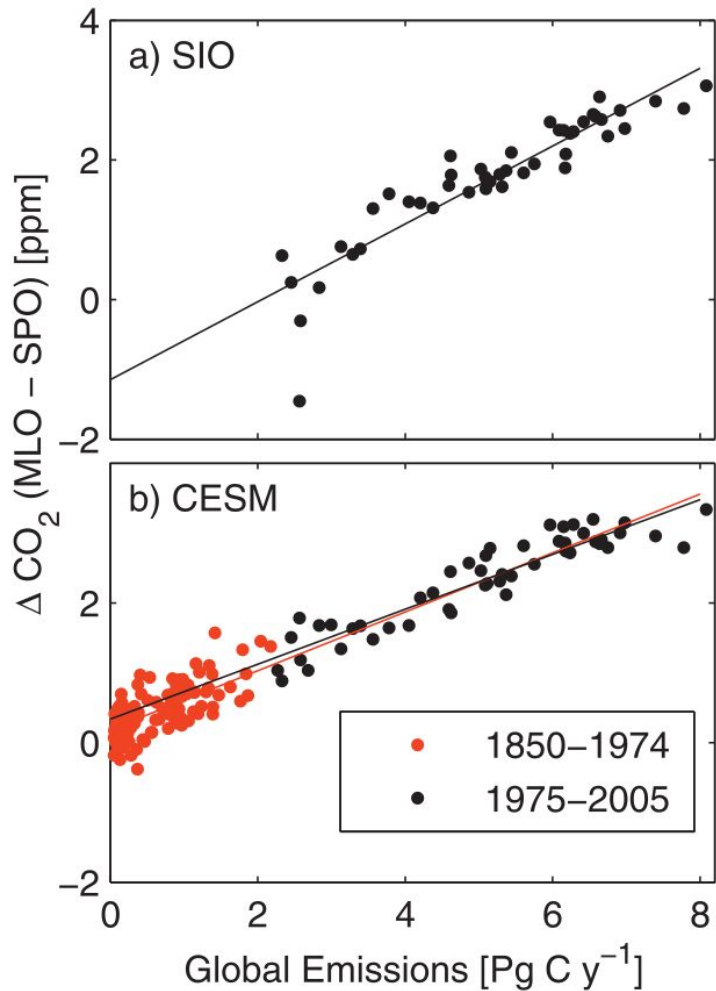

**Fossil fuel CO<sub>2</sub> is emitted to the atmosphere according to a spatial and seasonal pattern**

BHIST1

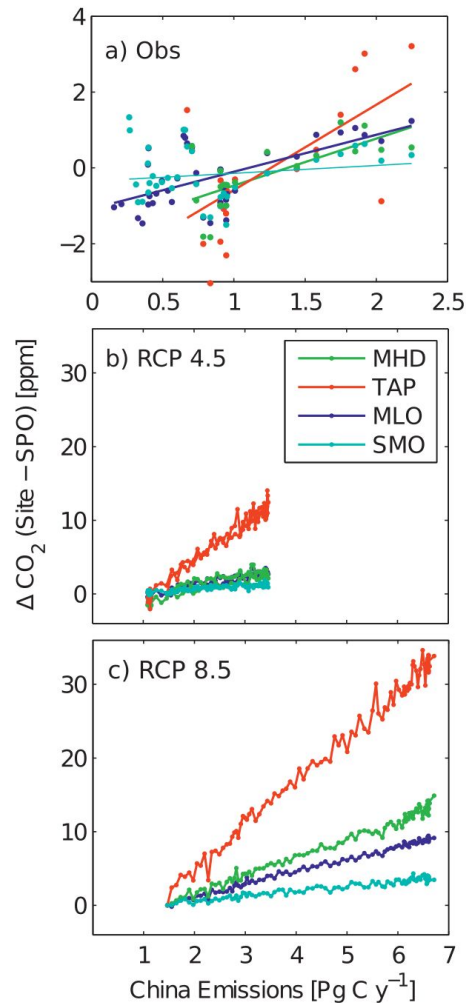

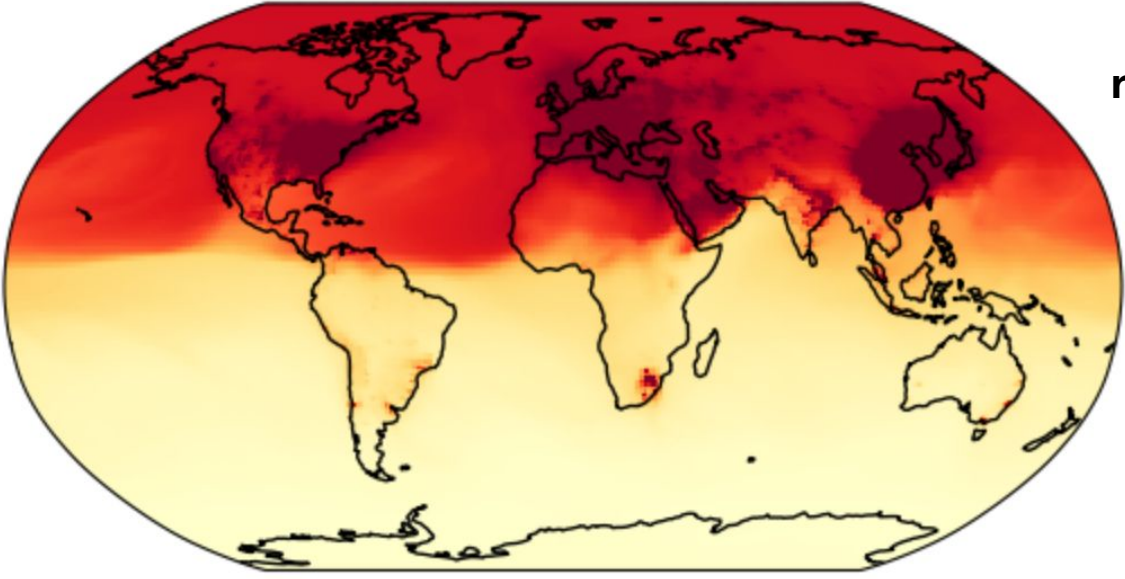

**The interhemispheric contrast in  $\text{CO}_2$  reflects the fact that most fossil emissions are in the Northern Hemisphere**

**Tracking 4-D  $\text{CO}_2$  fields in CESM enables us to project how observations will change with changing emissions and associated feedbacks in land and ocean carbon uptake**

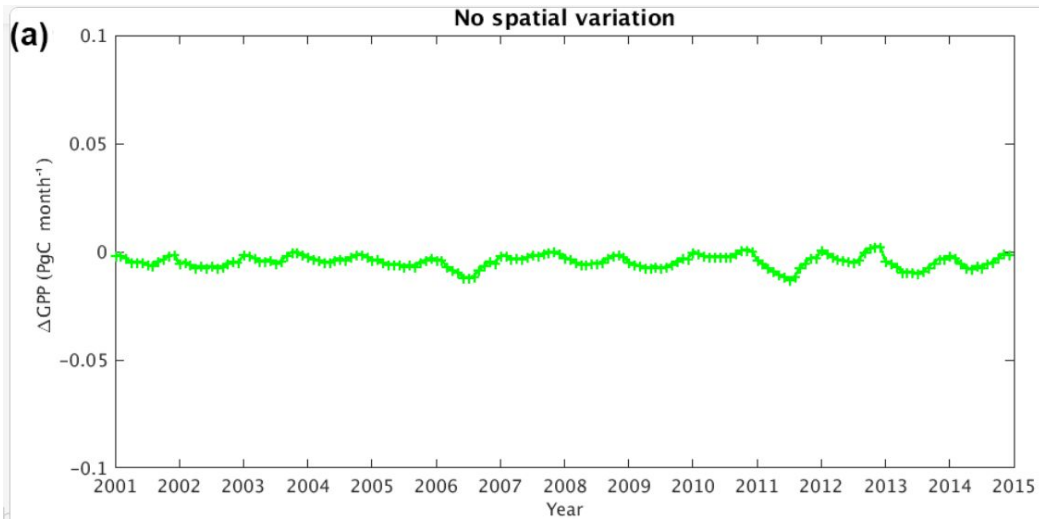

BHIST1

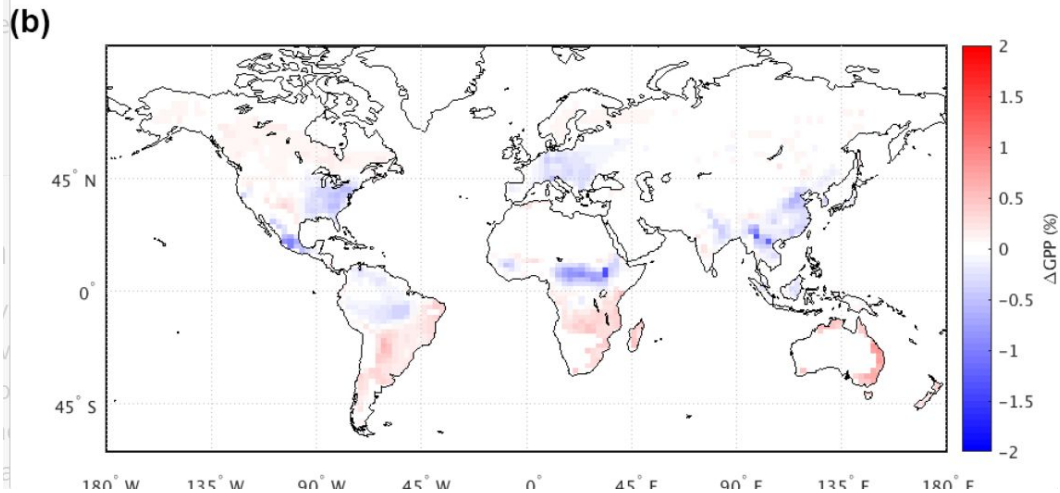

**Fossil fuel CO<sub>2</sub> is emitted to the atmosphere according to a spatial and seasonal pattern, resulting in distinct atmospheric patterns of variability**

**Why should a bunch of terrestrial ecologists care?**

**Spatial variations in  $\text{CO}_2$  can change GPP through local fertilization effects**

Lee et al., 2018

**Why should a bunch of ocean biogeochemists care?**

**Spatial variations in CO<sub>2</sub> can change ocean uptake due to local differences in the air-sea pCO<sub>2</sub> contrast**

BHIST1

July

BHIST1

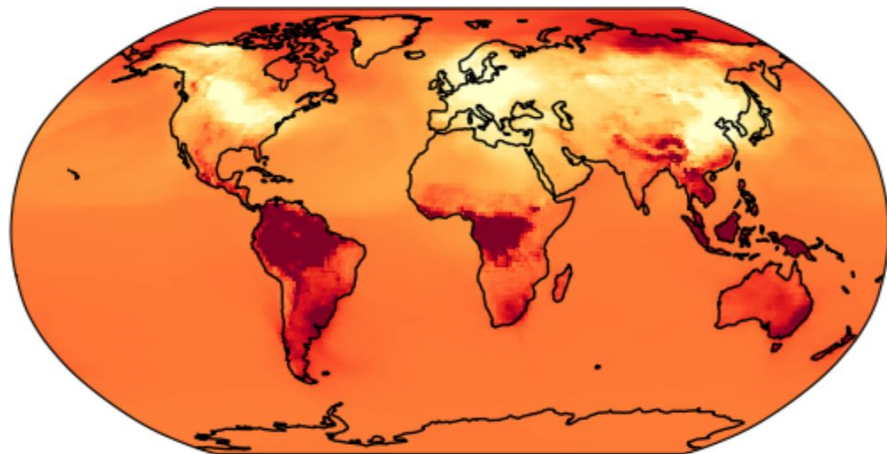

January

Of course, spatiotemporal variations in air-sea CO<sub>2</sub> fluxes are also tracked within CESM, resulting in modest spatial gradients in CO<sub>2</sub>

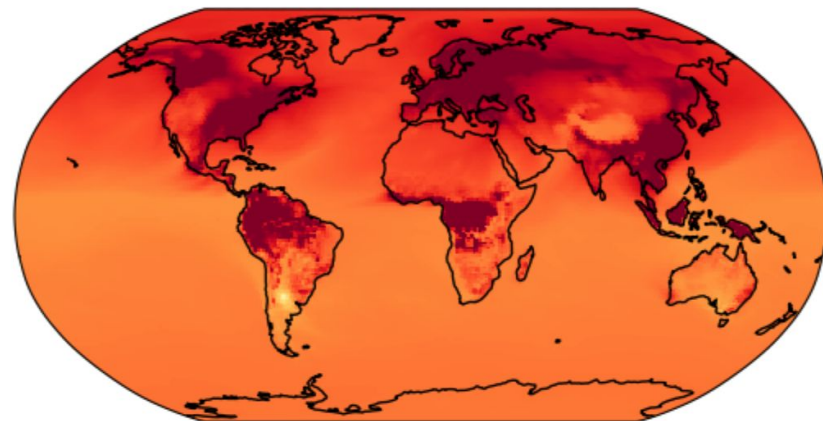

BHIST1

July

BHIST1

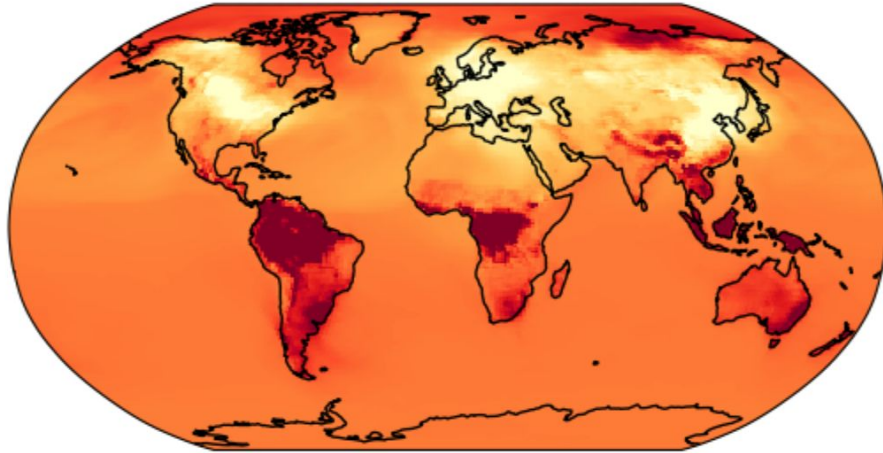

January

**Land-atmosphere carbon exchange leaves a much larger imprint on atmospheric CO<sub>2</sub> than does ocean exchange**

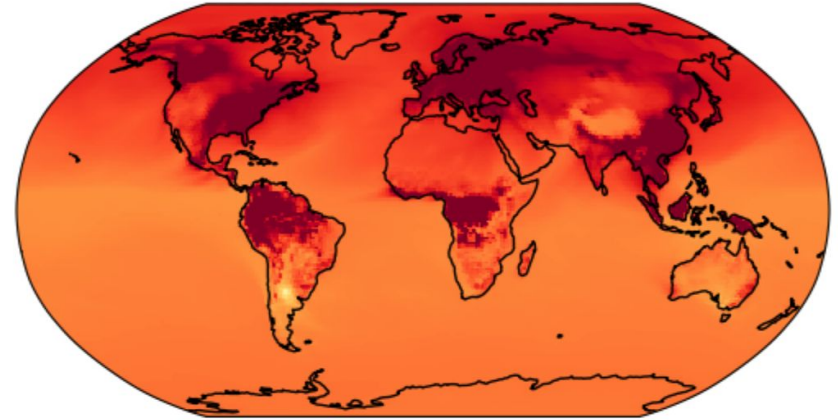

BHIST1

July

BHIST1

January

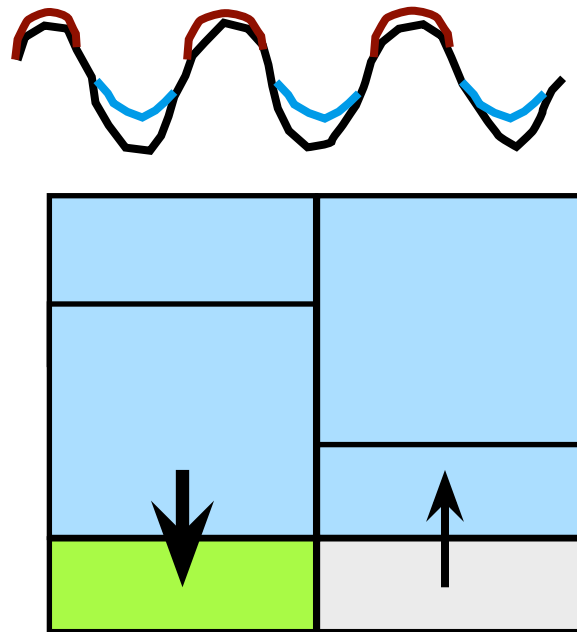

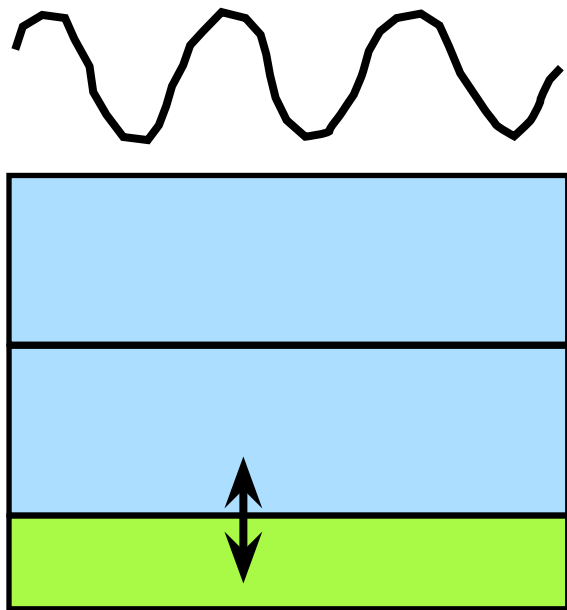

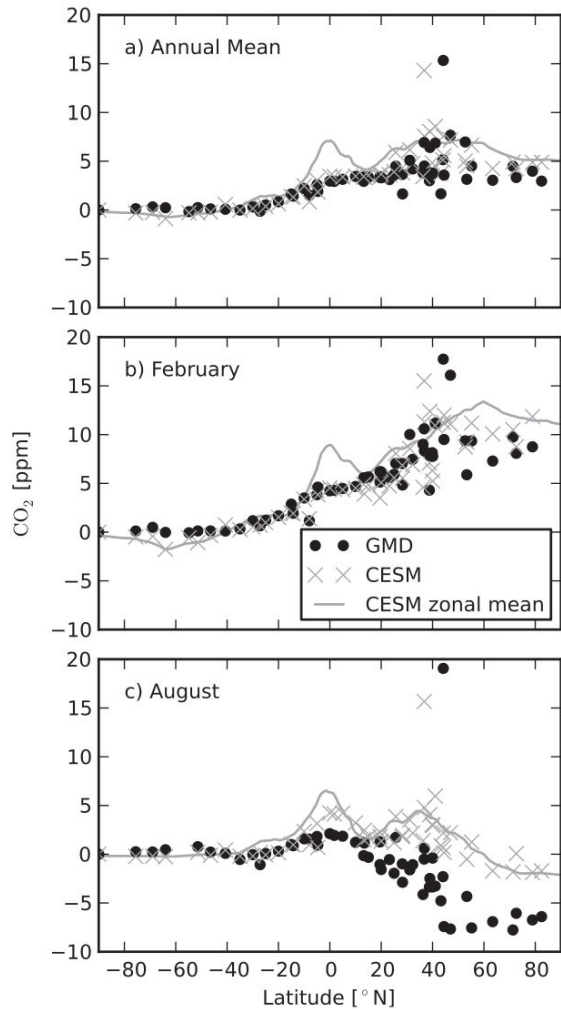

**But why is CO<sub>2</sub> so high over tropical forests?!**

# Effect of boundary layer height on CO<sub>2</sub> signals

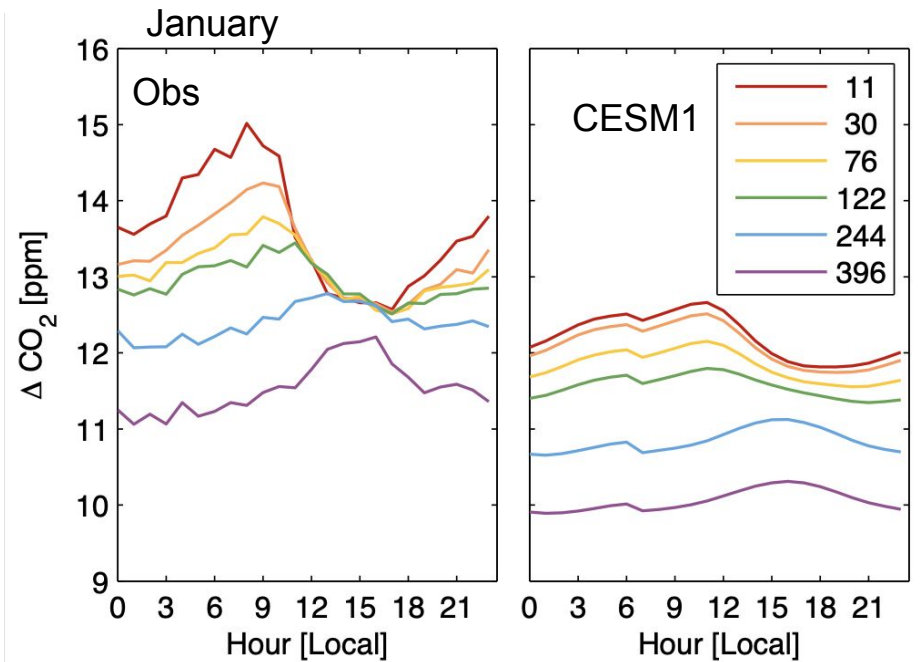

# Effect of boundary layer height on CO<sub>2</sub> signals

**We see evidence of this rectifier effect in CESM1, where we also used atmospheric CO<sub>2</sub> comparisons with observations to reveal too-weak seasonal exchange**

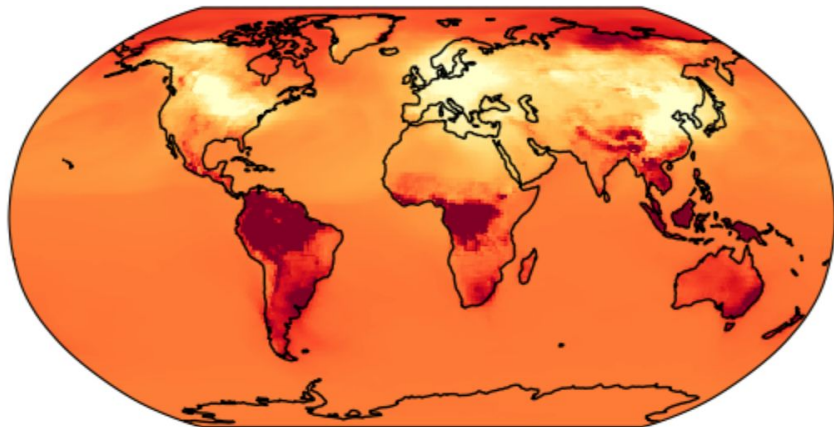

( $\text{CO}_2$  reported relative to South Pole)

**Observations of the diurnal cycle in  $\text{CO}_2$  are hard to come by, or hard to interpret**

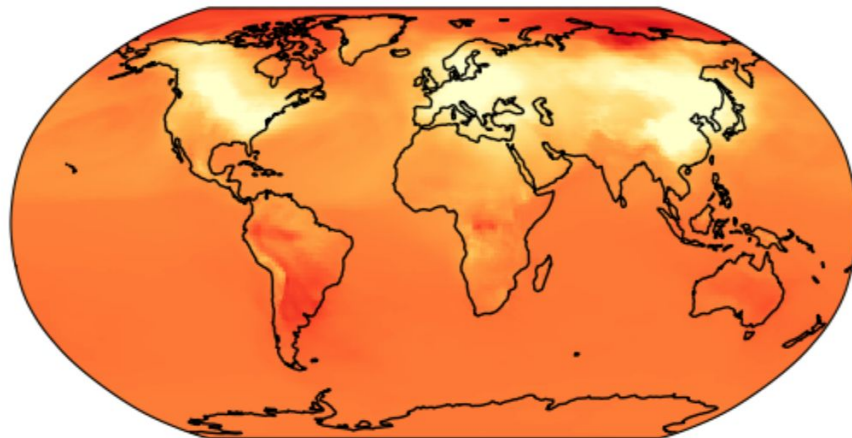

BHIST1

**July - 1st model layer**

BHIST1

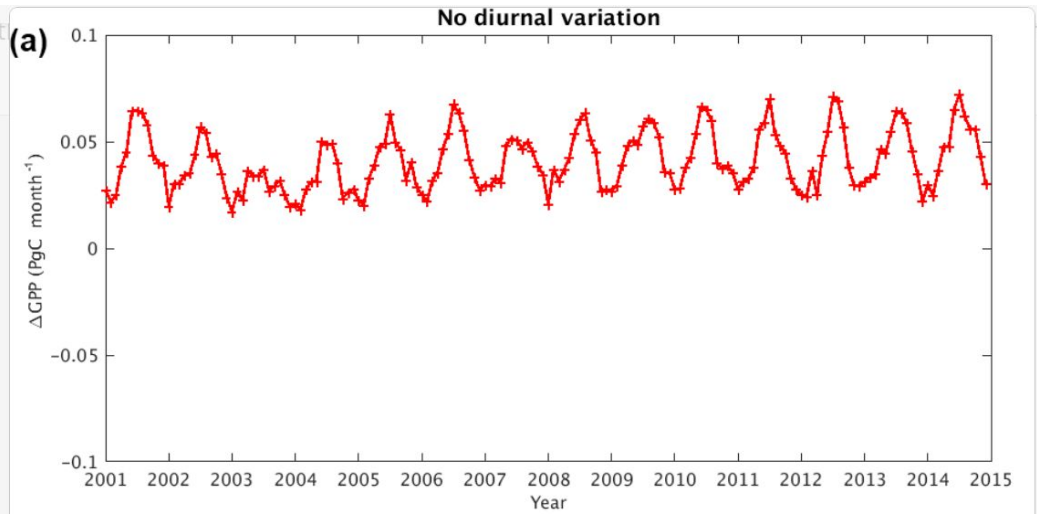

**July - 3rd model layer**

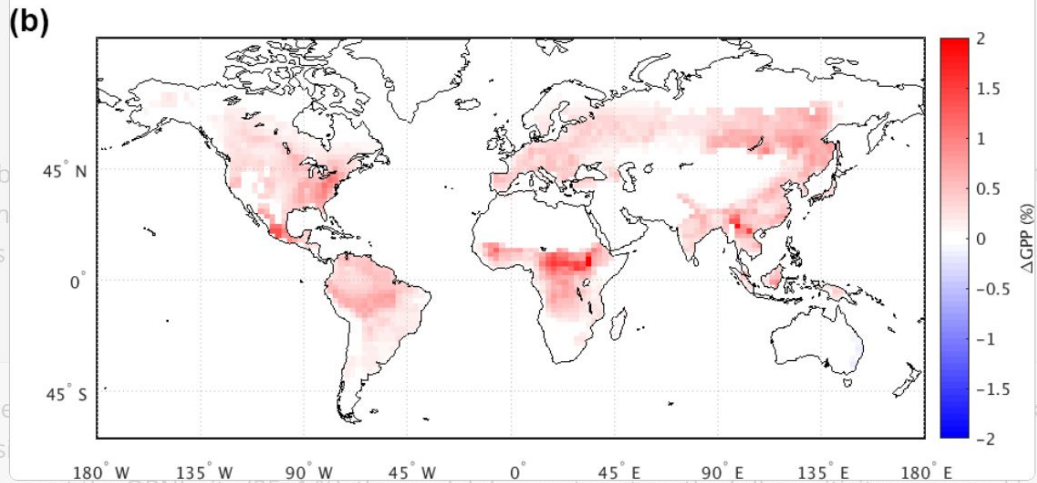

**If we look at CO<sub>2</sub> in the third model layer, the rectifier problem is essentially gone**

**But it's important to note that the diurnal cycle in boundary layer CO<sub>2</sub> also affects terrestrial fluxes**

Lee et al., 2018

**Tracking CO<sub>2</sub> provides a means to diagnose spatiotemporal variations in land, ocean, and fossil fluxes**

**Simulating 4-D variations in CO<sub>2</sub> enables concentration-driven feedbacks within CESM**

**This opens up lots of cool science in emissions driven simulations!**

**It is very hard to decouple the imprint of fluxes and transport on atmospheric CO<sub>2</sub>, to proceed with caution**
